

Where the added wildfire CO2 pathway increases modeled climate damages

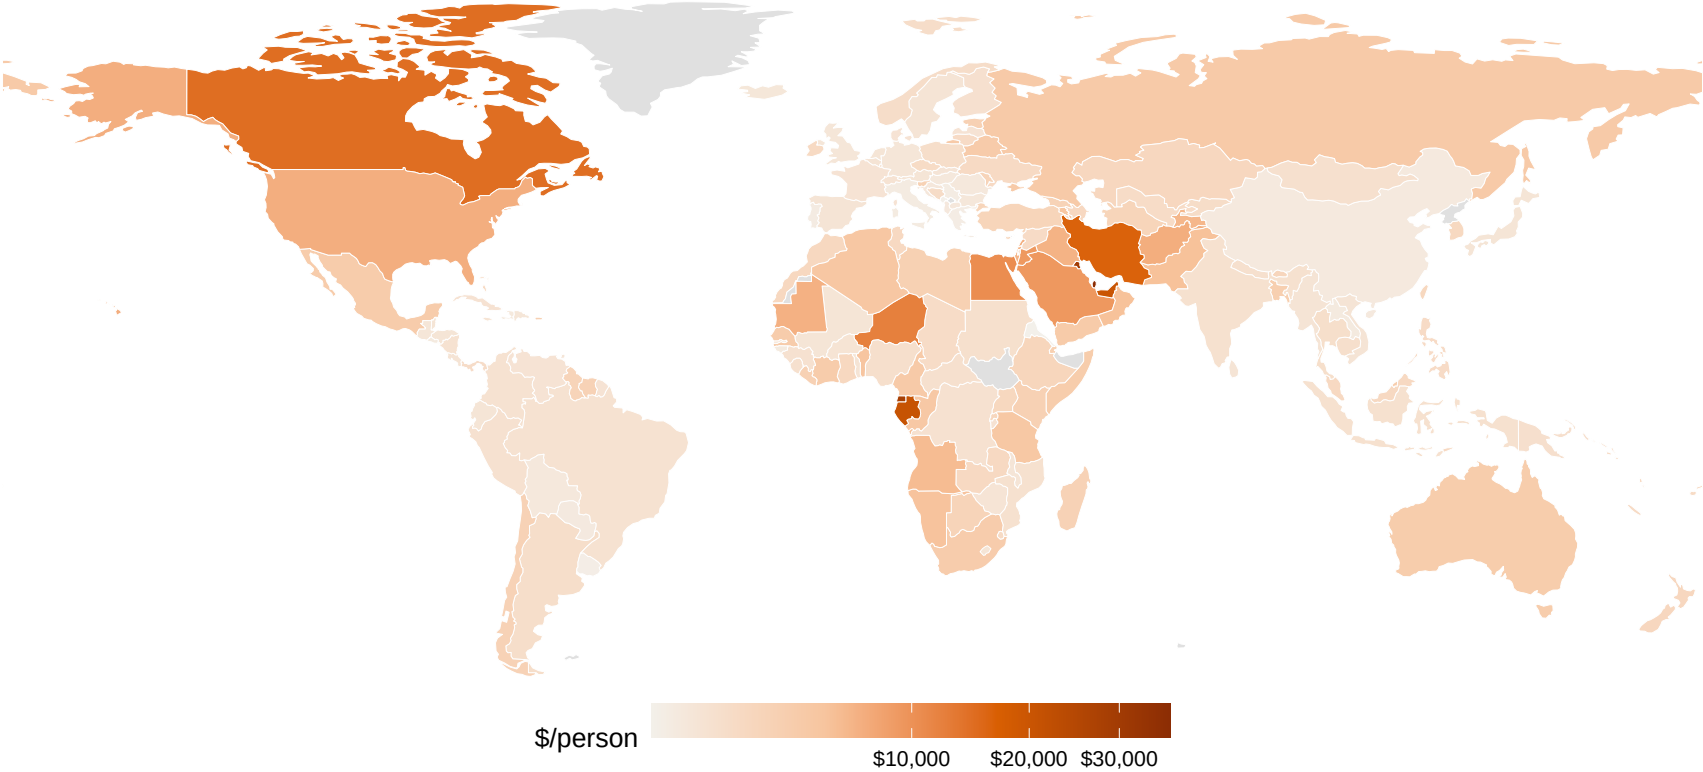

Present value of added core damages

Billion 2020 USD, discounted with the 2% Ramsey specification.

Present value per 2020 resident

2020 USD per person; same damages divided by 2020 population.

Diagnostic country allocation for the deterministic source-informed mean pathway. Includes GIVE core temperature mortality, energy and agriculture only; excludes CIAM sea-level damages, smoke mortality and non-CO2 fire forcers. Agriculture is allocated from FUND regions to countries by GDP share.
