

SCC distribution, central 2% discount-rate case

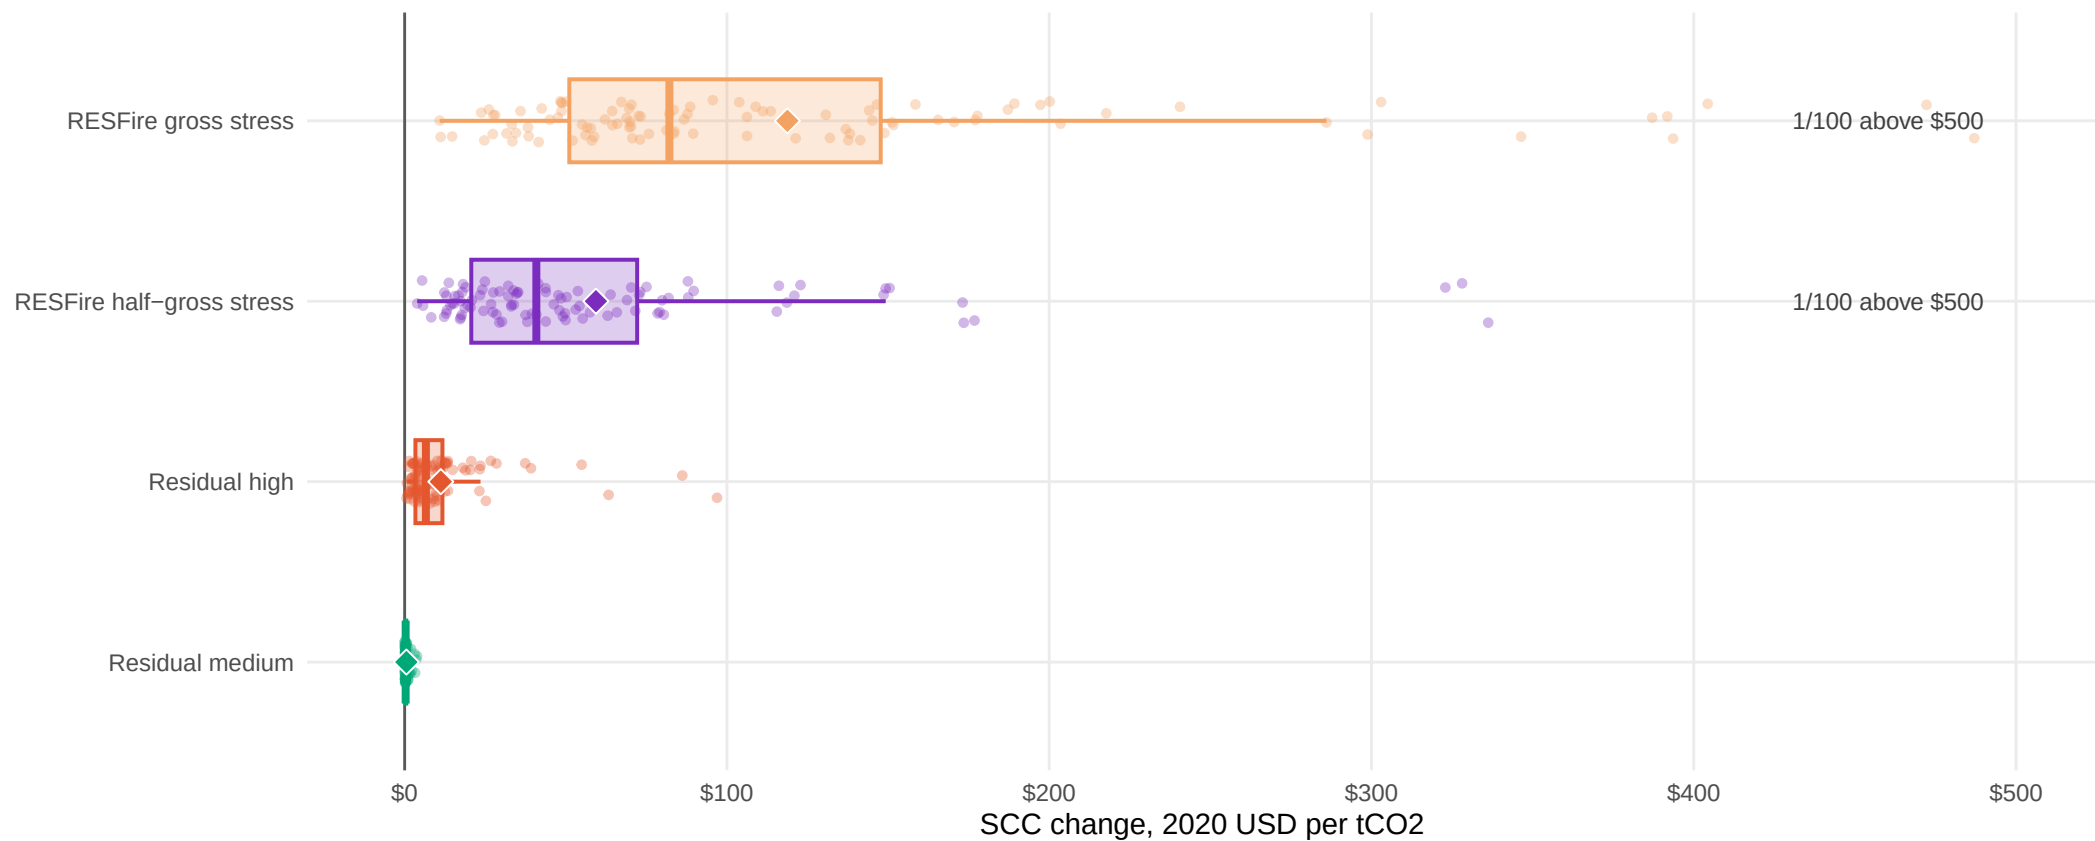

Right tail truncated at \$600/tCO2; labels report hidden tail counts. Vertical lines are means; points are medians.

Paired 100-run validation sample. Means and medians are computed on full samples, not only the visible range.

Paired SCC increase relative to baseline

Each point subtracts the matched baseline draw from the wildfire-feedback draw; x-axis truncated at \$500/tCO2.

Paired draws hold RFF-SP, FAIR, and discounting samples fixed within trial.

SCC densities are visually truncated at \$600/tCO2; all means, medians and paired deltas use the full untruncated 100-draw validation samples.
